CircuitPython driver for 74HC165 shift register.

DEPENDENCIES

This driver depends on:

- [Adafruit CircuitPython](#)
- [Bus Device](#)

Please ensure all dependencies are available on the CircuitPython filesystem. This is easily achieved by downloading the [Adafruit library and driver bundle](#) or individual libraries can be installed using [circup](#).

INSTALLING FROM PYPI

On supported GNU/Linux systems like the Raspberry Pi, you can install the driver locally [from PyPI](#). To install for current user:

```
pip3 install woolseyworkshop-circuitpython-74hc165
```

To install system-wide (this may be required in some cases):

```
sudo pip3 install woolseyworkshop-circuitpython-74hc165
```

To install in a virtual environment in your current project:

```
mkdir project-name && cd project-name  
python3 -m venv .env  
source .env/bin/activate  
pip3 install woolseyworkshop-circuitpython-74hc165
```

USAGE EXAMPLE

```
import time
import board
import digitalio
import wws_74hc165

latch_pin = digitalio.DigitalInOut(board.D5)
sr = wws_74hc165.ShiftRegister74HC165(board.SPI(), latch_pin)

pin1 = sr.get_pin(1)

while True:
    print(f"pin 1 = {pin1.value}")
    time.sleep(1)
```

Also see the [Adding Digital I/O To Your CircuitPython Compatible Board: Part 2 - The 74HC165 tutorial](#) on [Woolsey-Workshop.com](#) for additional usage information.

CONTRIBUTING

Contributions are welcome! Please read our [Code of Conduct](#) before contributing to help this project stay welcoming.

DOCUMENTATION

For information on building library documentation, please check out [this guide](#).

TABLE OF CONTENTS

6.1 Simple test

Ensure your device works with this simple test.

7 import time
8 import board
9 import digitalio
10 import wws_74hc165
11
12 latch_pin = digitalio.DigitalInOut(board.D5)
13 sr = wws_74hc165.ShiftRegister74HC165(board.SPI(), latch_pin)
14
15 pin1 = sr.get_pin(1)
16
17 while True:
18     print(f"pin 1 = {pin1.value}")
19     time.sleep(1)
```

6.2 wws_74hc165

CircuitPython driver for 74HC165 shift register.

- Author(s): John Woolsey

6.2.1 Implementation Notes

Based on Adafruit_CircuitPython_74HC595 driver library.

Hardware:

- 74HC165 Shift Register

Software and Dependencies:

- Adafruit CircuitPython firmware for the supported boards: <https://github.com/adafruit/circuitpython/releases>
- Adafruit's Bus Device library: https://github.com/adafruit/Adafruit_CircuitPython_BusDevice

class `wws_74hc165.DigitalInOut` (*pin_number*, *shift_register_74hc165*)

Digital input/output of the 74HC165. The interface is exactly the same as the `digitalio.DigitalInOut` class, however note that by design this device is INPUT ONLY! Attempting to write outputs or set direction as output will raise an exception.

Specify the pin number of the shift register (0...7) and the `ShiftRegister74HC165` instance.

property `direction`

Direction can only be set to INPUT.

property `pull`

Pull-up/down is not supported, return None for no pull-up/down.

switch_to_input (***kwargs*)

`DigitalInOut` `switch_to_input`

switch_to_output (*value=False*, ***kwargs*)

`switch_to_output` is not supported.

property `value`

The value of the pin, either True for high or False for low.

class `wws_74hc165.ShiftRegister74HC165` (*spi*, *latch*, *number_of_shift_registers=1*)

Initialize the 74HC165 on the specified SPI bus and indicate the number of shift registers being used.

get_pin (*pin*)

Convenience function to create an instance of the `DigitalInOut` class pointing at the specified pin of this 74HC165 device.

property `gpio`

The raw GPIO input register. Each bit represents the input value of the associated pin (0 = low, 1 = high).

property `number_of_shift_registers`

The number of shift register chips.

INDICES AND TABLES

- genindex
- modindex
- search
